The name Autodesk comes from the name of the company formed to develop and market AutoCAD, "Autodesk Inc.," based in San Rafael, CA. AutoCAD was originally designed to meet the need for a sophisticated desktop CAD program, such as the one used by a civil engineer or a mechanical engineer, that could run on the desktop of a personal computer and complement the user's graphic user interface (GUI) mouse. Thus AutoCAD is a CAD program that uses the mouse for the command function, as well as for navigating from one part of the design to another. To control the cursor, the mouse is used to click on and move icons on the screen. However, with time, AutoCAD's scope has evolved to support more complex and diverse types of CAD, including 2D and 3D drafting, Civil 3D, Architectural 3D, Landscape 3D, Mechanical, Site 3D, Space 3D, and Utilities 3D. These other applications are all integrated with the AutoCAD product. AutoCAD was developed by Autodesk as a desktop CAD application. To control the cursor, the mouse is used to click on and move icons on the screen. A button on the mouse is used for the command function, and a separate push-button is typically used for navigating from one part of the design to another. A mouse is used in both the 2D and 3D version. A design may be composed of multiple sheets or project files. A sheet, or drawing, is the fundamental unit of a drawing and is an unorganized collection of objects (objects in 2D or 3D). In a project file, the design is divided into multiple sheets, each of which may be stored in a separate file. AutoCAD is structured for productivity by presenting design information in the form of sheets, each of which is made up of a number of objects. In this way, AutoCAD strives to make drawing, creating, and editing much more intuitive. There are four main functions of a drawing: 1) Create a drawing. The designer works on a sheet by creating a number of objects. These objects may be any of the 3D objects that are created using a keyboard or 3D mouse or 2D objects that have been created using a keyboard. The choice of objects depends on the user's needs.

Line drawings The drawing units for drawing in AutoCAD and other CAD programs are the point, the line and the plane. There are also several symbols such as circles, triangles, and rectangles. The line, as in other drafting programs, can be subdivided into several segments called lines. To draw such a line, the segment can be selected using the Select tool, with one of the tools for segment selection, which include Tape Measure, Chain-Link and the Arrow tool. The Line tool is most commonly used to draw a line and delete it. Points are drawn by using the Push or Enter key. To connect two points, select them both using the Select tool. Then use the Line tool to draw the line. Selecting another point and pressing Enter will connect the previously selected points and draw a line through them. Planes are lines drawn along a three-dimensional surface. To draw a plane, select it using the Select tool. Then use the Line tool to draw a line parallel to the selected plane. There are several tools to make these selections, the most common being the Select tool, the Tape Measure tool, the Chain-Link tool, and the Arrow tool. Drawing The basic drawing tools can be used to draw simple two-dimensional shapes, including arcs, circles, lines, polygons and elliptical shapes. The tool also has a drawing style, called Drafting Style, which can be used to draw lines with a desired angle, line width, smoothness, and jaggedness. If the line is not given a drawing style, it will use the default one. The drawing tools are the most common tools for simple drafting work. Rectangles and circles can be selected with the Rectangle and Circle tools. To combine multiple rectangles or circles to make a shape, use the Union and Intersect tools. To draw a polygon, select the starting point, and then click points on the screen to define each line segment. The angle of each line segment can be adjusted using the arc tool. The Polyline tool is used to create closed polylines, such as circles, ellipses, arcs and convex polylines. To create a simple closed polyline, use the Polyline tool and the Line tool. To create a complex closed polyline, use the Polyline tool and the arc tool. Text objects The text editing tools in AutoCAD include the Type tool, the Paint Bucket tool and the Selection tool ca3bfb1094
