To estimate the life expectancy of rheumatoid arthritis (RA) and calculate the total costs of RA in Japan. The predicted mortality rates of Japanese were used as a basic data. Published articles and reports were used to estimate the survival rates of the disease at each age. The costs of rheumatic diseases in Japan were calculated by multiplying the estimated survival rates of RA by the estimated average annual direct and indirect cost of RA in Japan. The mean survival rate at each age was 4.9 years. The mean cost of RA in 1998 in Japan was

1.44 million yen, which corresponds to the direct cost of 0.98 million yen. The mean estimated total cost of RA for men and women in Japan for 1998 was 2.02 million yen. The average estimated total cost of RA patients in Japan from 1998 to 2040 is 50 billion yen. The mean life expectancy of RA patients was 57 years. These results showed that rheumatoid arthritis is a very serious disease affecting not only the quality of life but also the life expectancy of patients in Japan.

Add to list In my list Note that the photo above is a behind the scenes view of the lens assembly - my view from the side. It's not very clear but there are actually three elements (a lens and two reflectors) rather than one. And the center reflector is tilted 45 degrees from the lens, which helps eliminate double image when you use this lens with a telephoto lens. The SAMSUNG-branded 12.2 megapixel i60 camera (used in the photo above) will be announced in SIX more markets this year, starting with India in April. India is the second most lucrative market for i60, trailing Thailand, and the i60 has been an instant smash there, selling out of stock for the first time since launch. Interestingly, the Global Sales Manager for Samsung's mobile photography division, said that the camera had done particularly well in the US market, where it was "the number one handset camera."
