**Field of the Invention** The present invention relates to a body-work coating device and, more particularly, to a body-work coating device which can remove paint from a body with relative ease. A conventional method for removing paint on a body is to scrape off the paint layer using a scraper. However, the conventional method for removing paint with a scraper presents various problems, such as inconvenience and difficulty in carrying out the work. In addition, a conventional paint removing method is disclosed in U.S. Pat. No. 4,848,029. In this paint removing method, an object to be painted is passed through a vertically rotating vessel with air under pressure, which rotates about its center axis and contains a liquid cleaning material. The liquid cleaning material contains a chemical that dissolves or chemically binds to a material of the object to be cleaned. Thus, the object is first washed with the cleaning liquid, and then the object is rinsed by running water to remove the cleaning liquid. However, the cleaning liquid of the U.S. Pat. No. 4,848,029 is deteriorated by water. The present invention provides a body-work coating device, which can remove paint from a body without difficulties. The body-work coating device according to the present invention comprises a paint charging means and a painting means. The paint charging means collects paint and is constructed to rotate in clockwise or counterclockwise directions. The paint charging means includes an impeller comprising a rotation shaft and a plurality of blades mounted on the rotation shaft, to rotate about the rotation shaft. The blades are provided along the rotation shaft, and collect and transfer paint, which is sprayed from a paint spraying nozzle, to the paint charging means. In addition, the blades are arranged on a direction, which is perpendicular to a rotation axis of the rotation shaft, of the paint charging means. The painting means is formed, for example, in a spiral shape, which contains the paint charging means in its center, and transfers the paint of the paint charging means to a body to be coated. The paint charging means is constructed to move for each rotation of the rotation shaft. Therefore, the paint is effectively transferred to a coating area, which surrounds the paint charging means, and is sprayed from the paint spraying nozzle of the paint charging means. The paint charging means may be constructed in a vertically rotating shape, which rotates about its center axis, and also comprises an impeller having a plurality of blades, which are mounted

You can even use multiple layers to build up images that show multiple layers of details. You can also merge a layer into another layer in order to work with a single image instead of several. When you open an image in Photoshop, a program window opens. The program window shows different viewports that you can use to work with an image. The Width tool allows you to change the width of an image or a single object in an image. The Height tool allows you to change the height of an image or a single object in an image.
