The "Elden Ring" is a fantasy action RPG made by Neople, so let's get to the major points in detail, starting with the introduction video! ~VINTAGE OLD-FASHIONED CAMERA~ The game is being released for mobile-friendly PlayStation®4, PlayStation®Vita, and PC on Sept. 11, 2017 in Japan. I will now introduce the staff of the Japanese development team behind the development. Eleanor (director/character artist): "In my previous works, I focused mainly on line drawings, but in the Elden Ring, it will be an action game, so I thought to put a little of myself into this project, and for that I researched how to

animate an action game, but more importantly, I thought about drawing the characters, 'This is a fantasy.' So I tried to express the feeling of 'It's fantastic!' and thought that if the basic feeling came from the action, we can pull off the entire concept." Alice (director/concept artist): "In my previous works, I focused more on illustrations using pencil and marker, but for the Elden Ring, I was asked to handle the characters by an action game, so I aimed for a high quality that even a play pattern could be understood, and I decided to draw it in a style to portray a sense of depth as I did for the illustrations." Takumi (character designer): "I was a game designer for Final Fantasy XIII at the time, so I thought it was a good opportunity to work on a new action RPG. I also had my own way to improve on Final Fantasy XIII, so I created some things that I could not have done in that game. One of them is the 'RPG' level in which you wield your sword and go in search of many monsters in one world with 'Action.' I also handled the characters, the story, and the music." Kaori (programmer): "I'm a third year student at Kyoto University of Arts. I previously worked on mobile games and made them with the Unity 3D engine, but for the Elden Ring, I decided to use the Unreal Engine because I had not done something in an RPG before, so I thought it would be an exciting challenge."

The present invention relates generally to a hydrogen tank and, more particularly, to a hydrogen tank having a cell for generating hydrogen. Hydrogen has been recognized as a clean fuel alternative for powering vehicles and as a possible replacement for diesel fuel for powering diesel engines. Hydrogen is also being developed as a replacement for natural gas. For example, hydrogen can be produced in hydrogen stations, converted to hydrogen-containing gas in fuel cells, stored as compressed gas or liquid hydrogen, or other forms and then used to fuel combustion engines. However, improvements in the efficiency of generating and storing hydrogen are necessary for further development of hydrogen as a fuel. One advantage of fuel cells is that they produce electricity and water and emit only pure water as byproducts. Moreover, a fuel cell produces electrical power directly, as opposed to the conversion of chemical energy from a fuel to electrical energy as in combustion engines. Typically, fuel cells do not require an oxidizer to initiate combustion, and as a result, they have a higher efficiency than combustion engines. Unfortunately, hydrogen as a fuel and hydrogen-containing gas as an oxidizer are not readily available. For example, refueling stations for hydrogen and hydrogen-containing gas are not widely available. Therefore, the economy of using hydrogen as a fuel will depend largely on the development of methods to produce hydrogen efficiently and at low cost. Some methods for producing hydrogen have been proposed. For example, pyrolysis and reforming methods have

been developed for producing hydrogen from various fuels. The pyrolysis method produces hydrogen by heating a fuel to a high temperature at which the material decomposes to form a gas containing hydrogen. For example, a metal hydride is heated to produce hydrogen. In the reforming method, hydrogen is produced from a relatively small fuel containing hydrogen and carbon by steam and/or carbon dioxide reforming. The resulting hydrogen is then typically stored as a compressed gas in hydrogen tanks. Although these methods are generally very efficient, they are somewhat limited because of the very high temperatures and pressures required. Accordingly, an object of the present invention is to provide a hydrogen tank that can be used for storing hydrogen. Another object of the present invention is to provide a hydrogen tank that can be used for storing hydrogen and generating electricity.
