With over 30 million users, AutoCAD is the most popular of the Autodesk software portfolio. The company's other major software products are AutoCAD LT (which works on embedded systems and Windows), AutoCAD Architectural Desktop, Autodesk Inventor, Inventor (add-on products for AutoCAD), AutoCAD 360 3D and AutoCAD 360 Design. History 1980s The core of AutoCAD was originally released in December 1982 as a desktop application, based on a framework created for the first 16-bit graphics workstation, the AGPESS 16. Autodesk's first product was a graphics package named AGPESS (AutoGraphics Executing Sequentially) that contained a suite of standalone application programs written in Pascal. Autodesk contracted to market this product as TechDraw. Each of the three initial releases of AutoCAD: in May 1983, December 1983, and January 1984, was a complete product. Early in the product's development, Autodesk agreed to develop a CAD product specifically for the desktop market, since many companies were concerned about the difficulty of designing a Windows-based app. The first version of AutoCAD for the desktop market, which was released in May 1983, only supported vector data. Autodesk also planned to release other desktop CAD apps, in addition to AutoCAD, such as the electrical engineering program ADA; however, Autodesk's competitor, NACCO, developed and released its own CAD product, named CAD/CAM System, in 1984. AutoCAD's first release on the mainframe market was in 1984 as CAD/CAM System D. AutoCAD for mainframe computers was released in 1987, as CAD/CAM System D2000. Since then, AutoCAD has evolved into a full-featured design and drafting program, rather than a CAD/CAM program. 1990s In September 1989, AutoCAD was launched for Amiga computers, with the Amiga graphics software package Designer 3D included. In February 1990, the first version of AutoCAD for the embedded market was released, AutoCAD 90 for Micro AS/400 and iSeries, with Microsoft's Windows operating system. In November 1992, AutoCAD 95 for Windows was released, which brought with it the capability of importing most proprietary data formats, including DWG, DX

A general illuminating device which uses a fluorescent lamp as an illuminating light source has a fluorescent lamp in which light emitted from a mercury lamp and a phosphor are combined, and a cap in which the fluorescent lamp is disposed. When the illuminating device is in use, the fluorescent lamp is filled with inert gas such as Ar, Ne or Xe. When the fluorescent lamp is lighted, the pressure in the cap increases and the air in the cap is discharged out of the cap, thereby to prevent the inert gas from leaking from the cap and to keep the interior of the cap airtight. When the illuminating device is not in use, the fluorescent lamp is turned off. The cap is fixed to the housing of the illuminating device with screws, and air is supplied to the cap to suppress generation of heat from the cap. In the illuminating device, when the fluorescent lamp is turned off, the temperature of the

cap rises because of heat generated in the interior of the cap and radiates from the cap to the housing of af5dca3d97
