This invention relates to the manufacture of non-burning smokeless candles, and more particularly to a method of and an apparatus for burning a solid material as a heat source for providing a light-colored, non-burning smokeless candle. Candles are widely used as a source of light for home and work purposes. However, it is often desirable to reduce the amount of smoke and odors associated with the combustion of candles. A variety of devices and methods have been used in attempts to reduce the combustion of the candles while retaining the desired light and heat characteristics of the candles. One such method is to utilize a container for a source of heat, such as a candle, which has a wick extending upwardly therefrom. In operation, the wick is burned, but not completely consumed, so that upon combustion of the candle, the heat energy remains which is stored in the container and the candle wick serves as a conduit for the heat energy. The container can be such as the standard candle container of the candle manufacture in which a wick is disposed in the body of the candle. However, the container can also be of the non-burning type such as that described in U.S. Pat. No. 4,458,333, wherein the burning of the candle is prevented by a wick structure which is moved vertically from the burning end of the candle to an end of the candle that is not burned, and upon combustion of the candle, the heat energy is stored in the container and conveyed by the wick structure. In addition, U.S. Pat. No. 3,971,138 describes a candle structure having a tubular wall which has a plurality of axially extending slots therein. The wall is preferably formed of a translucent material to allow the passage of the light generated by the burning wick structure. One disadvantage of the use of candles for providing light in a room is that of the smoke and odor associated therewith. Accordingly, there have been developed and used candles which are smokeless, wherein the combustion of the candle is substantially prevented. However, the burning of these smokeless candles creates a significant amount of heat energy which is not readily usable, and the temperature of the candle must be substantially maintained for prolonged periods of time. This is the case because the heat generated by the combustion is conducted outwardly through the candle to the ambient environment surrounding the candle, and the heat energy which is not burned is dissipated into the surrounding environment as heat energy. In order to use the heat

Open and close drawings with ease: To open a closed drawing, simply use the Open command. To close an open drawing, simply use the Close command. This functionality eliminates the need to copy/paste, and also lets you use the Open/Close functionality in more scenarios, such as when you have multiple designs or when you want to share your models with others. Set the list of applications that should open a file. If you specify the AutoCAD folder, those settings apply to all new drawings automatically. (video: 1:03 min.) Save and recover drawings. Simply save your drawing and AutoCAD creates a backup file with an extension that begins with ".bak." You can preview the backup file before you save it, which means you can return to a previous version before the backup was created. Use the Shell window to view and navigate within your project. There are no more full-page screenshots. You can find the features listed on the pane below the viewer. Recover line styles, markers, and dimensions to be used when you reopen a file. New AutoCAD commands: New commands in AutoCAD 2023 let you work with your drawing, from command line or interactive with AutoLISP code. (video: 3:07 min.) Part names: In AutoCAD, you type or drag your hands to parts that you select on the screen, or you type the name of a part into the part text box. Smart guides: You can create blocks, lines, and frames that automatically follow existing geometry and other designated guides. Graphical legends: Add a single arrow or circle to the shape's legend to mark a hotspot or an error. Better undo and redo: The undo and redo commands in AutoCAD have been improved to better track changes. The Undo command now preserves changes across drawings. The Redo command now supports the Undo, Redo, or Undo/Redo commands in the command bar to undo multiple steps. The Mark command, which lets you mark layers or objects, now works in drawing

documents. You can use the Mark command to mark objects and avoid the need to create temporary markings or annotate. (video: 1:42 min.) The Add submenu supports annotation, so you can
