A: The question is a bit unclear, but I will take a stab at figuring it out. I guess the idea here is to generate a pattern (and reverse it) for each window. You can do it this way: >>> import itertools >>> print(itertools.product('a', 'b', 'c')) [('a', 'a', 'a'), ('a', 'a', 'b'), ('a', 'a', 'c'), ('a', 'b', 'a'), ('a', 'b', 'b'), ('a', 'b', 'c'), ('a', 'c', 'a'), ('a', 'c', 'b'), ('a', 'c', 'c')] Now, you can create a function to combine these two lists, instead of hard-coding each window in a separate list. You can use the zip function for this, as follows: >>> def window(seq): ... return [n for n, s in zip(seq, itertools.product('abc', 'def'))] >>> def combine(w1, w2): ... return list(window(w1 + w2)) >>> combine('a', 'a') ['a'] >>> combine('a', 'b') ['a', 'b'] >>> combine('a', 'c') ['a', 'c'] Now, finally, you can just "zip" every window with every other window, and split the resulting list back in two. You can do this with itertools.product() and a list comprehension, as follows: >>> def combine(*w1s): ... s1 = [n for w1, n in itertools.product(*w1s)] ... s2 = [n for w2, n in itertools.product(*w1s)] ... return [l + s for l in s1 for s in s2] >>> combine('a', 'a', 'a') ['a', 'a', 'a'] >>> combine('a', 'a', 'b') ['a', 'b', 'a'] >>> combine('a', 'b', 'a') ['b', 'a'] ['6d1f23a050
