Adobe has updated the Brush dialog to make it much easier to create looks that utilize smart adjustments in an image. For example, vignette can now be applied to a brush and the amount of vignette applied alongside a color adjustment slider, such as a Color Balance adjustment, can be adjusted as well. I also find that Enhance Details is a very interesting feature. It allows you to apply a vignette to an image in which nearby areas are enhanced using some clever proprietary technology. The vignette can also be applied to a selection, which is a really great feature for drawing your focus onto one object, whether it's a specific spot you want enhanced or whether it's a specific object you want to make stand out. We've been hearing about AI for years now. A seemingly brilliant photo editor called AI is gradually replacing the classic tools in my toolbox. I don't think I've ever thought that AI would be a game changer, but boy, I was wrong. Currently, it's a very slow, clunky and incomplete, but it's a big part of the future and full resolution support is coming. The UI is incredibly annoying and often very slow to update. However, all these downsides are easy to look past when you've got really good photography to work with. I'm glad that the timeline is getting a redesign. There are more video elements that are always imported into Photoshop and it would be nice to be able to manage them better. We are also going to see improved LUT support and AI content-aware editing will learn from your images. Obviously, AI content-aware is not just about removing elements that look like they belong to another object in an image. AI could be used to replace and enhance things from your camera's native LUT. This, at times, can be really nice, but also has the potential to make you look very silly if it's not handled carefully.
